

---

## **PREFACE**

---

Future prospects for the New Zealand potato industry are for increased production — particularly for the export of processed products, and increased pressure for a high quality product — for both processing and table ware. Choice of cultivar and management are important factors in producing high yields of quality tubers. This publication outlines a number of aspects of potato breeding and agronomy presented at a symposium on potato agronomy held in conjunction with the New Zealand Potato Board 2nd National Potato Industry Convention, June 1983.

The Agronomy Society is grateful to the New Zealand Potato Board, particularly the South Island Liaison Officer Mr H.B. Maunder, for assistance in organising the symposium; the symposium convener, Mr G.D. Hill; session chairmen; DSIR staff, particularly Mr R.A. Genet, Miss V. New and Miss A. White; and last but not least, the authors.

G.S. Wratt
